Overview of CPG Development Process

- Determine important topics for clinical practice
- Critically review previous CPG
  - Determine scope of CPG
  - Prepare for and conduct patient focus group
  - Consider previous CPG recommendations and evidence base
  - Develop KQs
  - Develop and finalize evidence review protocol
  - Conduct evidence review and review results
  - Develop new evidence-based recommendations (covered by KQs)
  - Update previous CPG recommendations (covered by KQs)
  - Refine recommendations carried forward (not covered by KQs)
  - Draft, review, and revise CPG using iterative process
  - Develop patient and provider toolkit materials
  - Finalize CPG and toolkit materials

Recommendation development meeting

KQ finalization meeting
Grading Recommendations - GRADE

Evidence-based clinical practice recommendations were developed based on the:

- Evidence review, which was informed by 12 key questions
- GRADE (Grading of Recommendations Assessment, Development and Evaluation) methodology and use of four decision domains to determine strength (Strong or Weak) and direction (For or Against) of each recommendation:
  - Confidence in the quality of evidence
  - Balance of desirable and undesirable outcomes
  - Patient values and preferences
  - Other implications (e.g., equity, resource use)
Strength of a Recommendation

Strength of a recommendation on a continuum:

- **Strong for** (or “We recommend…”)
- **Weak for** (or “We suggest…”)
- **Neither for nor against** (or “There is insufficient evidence…”)
- **Weak against** (or “We suggest against…”)
- **Strong against** (or “We recommend against…”)
### Categorizing Recommendations

\(^a\) Adapted from the NICE guideline manual (2012)\(^1\) and Garcia et al. (2014)\(^2\).

\(^b\) The topic of this recommendation was covered in the evidence review carried out as part of the development of the current CPG.

\(^c\) The topic of this recommendation was not covered in the evidence review carried out as part of the development of the current CPG.

Pregnancy trends in the United States

Slides 8-22 drawn from slides developed by Sandra R. Schumacher PhD, WHNP - BC, CNM and Sophia Hill-Smith MSN, RN
Birth rates in the United States 1970-2021

Figure 1. Live births and general fertility rates: United States, 1970–2021

NOTE: Rate for 2020 has been revised and differs from that published in "Births: Final Data for 2020."
SOURCE: National Center for Health Statistics, National Vital Statistics System, Natality

*Per 100,000 live births

Pregnancy-related mortality ratio

U.S. Maternal Mortality Rate Has Been Getting Worse over Time

Deaths per 100,000 live births

Pregnancy-Related Mortality Ratio by Race/Ethnicity: 2017-2019

- Non-Hispanic Native Hawaiian or Other Pacific Islander: 62.8
- Non-Hispanic Black: 39.9
- Non-Hispanic American Indian or Alaska Native: 32
- Non-Hispanic White: 14.1
- Non-Hispanic Asian: 12.8
- Hispanic: 11.6

*Per 100,000 live births

Rurality and Access to Care

- Rural residents have a 9 percent greater probability of severe maternal morbidity and mortality, compared with urban residents.

- Variability in the risk of death by geographic location groups might reflect chronic health conditions and access to care (e.g., rural residents may face challenges such as distance from and lack of access to obstetric services and providers) including risk-appropriate care.

- Over the past decade, the U.S. has seen an increase in obstetric unit closures in hospitals, leaving over 55% of rural counties without hospital-based maternity services.

- The loss is most prominent in rural communities with a high proportion of Black residents.
Key Points

- Pregnancy-related deaths are increasing in the United States
- Uncertain reasons . . .
- People at increased risk for pregnancy-related death include:
  - Older maternal age at delivery
  - Live in a rural area
  - Existing medical conditions (e.g., hypertension, chronic cardiovascular disease)
  - Race/ethnicity (e.g., Black, Native American) due to structural racism
  - COVID-19
Pregnancy in the DOD population
Pregnancy Statistics in DOD (2015-2021)

- **Active Duty Service members** – 95,534 live births
  - Highest in 2020 – 13,854
  - Lowest in 2021 – 12,841
  - 67.6% (63,906) – delivered in an MTF

- **Dependents** – 562,318 live births
  - 89,326 in 2015 to 71,900 in 2021
  - 20% decrease in live births for dependents
  - 32.9% (185,000) – delivered in an MTF

Source: Department of Defense Birth and Infant Health Research (BIHR) program: Select reproductive health outcomes, 2015-2021; BIHR response to data request, December 9, 2022.
Pregnancy in the Veteran Population
Age Distribution Among Female Veteran VHA Patients, FY00 and FY20

Cohort: Women Veteran VHA patients with non-missing ages 18-110 years (inclusive) in FY00 and FY20. Women in FY00: N=159,553; FY20: N=557,967.

Source: WHEI Master Database, FY00-FY20
VHA-Covered Obstetric Deliveries among Female Veteran VHA Patients, FY2010-2020

VHA Maternity Care Data

• Data for VHA Maternity Care has been challenging to capture

<table>
<thead>
<tr>

• People at increased risk for pregnancy-related death include:
  – Older maternal age at delivery
  – Live in a rural area
  – Existing medical conditions (e.g., hypertension, chronic cardiovascular disease)
  – Race/ethnicity (e.g., Black, American Indian/Alaskan Native)
Veteran Maternal Health

• Veteran population has characteristics that put them at higher risk of severe maternal morbidity and mortality
  
• A higher proportion of female Veterans are Black (31%) than in the general population

• Characteristics of Veterans who use VA for maternity care:
  – Mental health comorbidities
  – Advanced maternal age
  – Hypertension
2023 Pregnancy CPG Overview
2023 Pregnancy CPG Overview

- Update of the previous version of the CPG published in 2018
- Evidence used in the update published through June 1, 2022
- 28 evidence-based recommendations categorized into the following key areas

**Routine Care**
- Aneuploidy Screening
- Lactation
- Pelvic Floor Health
- Selected Conditions

**Complicated Obstetrics**
- Preterm Delivery
- Hypertensive Disorders
- Bariatric Surgery

**Mental Health**
- Screening for comorbidities
- Treatment

- Algorithm provides recommended interventions by weeks of gestation
- Additional sections include Referral indications, Emerging Topics, and Research priorities

Scope of the Guideline

- **Audience**
  - VA and DoD providers and other providers involved in the care of pregnant patients
  - Community-based providers involved in the care of pregnant Service members, beneficiaries, or Veterans

- **Population**
  - Pregnant patients who are eligible for care in the VA or DoD health care delivery systems and those who receive care from community-based clinicians
  - This includes Veterans, Service members, and their dependents
Routine Obstetric Recommendations
Pelvic Floor Question

- In pregnant and postpartum patients, what is the effectiveness and comparative effectiveness of pelvic muscle physical therapy/training in patients during the pregnancy and postpartum period?

<table>
<thead>
<tr>
<th>Recommendation</th>
<th>Strength</th>
<th>Category</th>
</tr>
</thead>
<tbody>
<tr>
<td>Routine Care</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Selected Conditions</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Pelvic Floor Health</td>
<td></td>
<td></td>
</tr>
<tr>
<td>5. We suggest all patients have an early prenatal evaluation of pelvic floor muscle function and receive pelvic floor muscle exercise instruction during pregnancy for the prevention of urinary incontinence in late pregnancy and up to 6 months postpartum.</td>
<td>Weak for</td>
<td>Reviewed, New-added</td>
</tr>
<tr>
<td>6. We suggest referral to pelvic health rehabilitation for patients with reported urinary incontinence in the postpartum period.</td>
<td>Weak for</td>
<td>Reviewed, New-added</td>
</tr>
</tbody>
</table>
Pelvic Floor Discussion

- Moderate evidence suggested that PFMT exercise initiated during early pregnancy (mixed prevention and treatment) reduced the prevalence of urinary incontinence for all patients in late pregnancy and up to 6 months postpartum.
- The Work Group’s confidence in the quality of the evidence was low due to limitations.
- Evidence indicated no significant reported harms or adverse outcomes associated with PFMT exercises in the reviewed studies.
- The patient focus group findings cited desires for enhanced consideration of co-occurring health conditions and improved access to rehabilitation resources in the postpartum period. The benefits of supervised pelvic muscle training by a rehabilitation provider improved rates of urinary incontinence and QoL measure scores that outweighed the potential harms (no reported significant adverse outcomes) or burdens (increased health care use rates).
Lactation Questions

- In pregnant and postpartum patients, what factors impact initiating and continuing breastfeeding or lactation?
- In pregnant and postpartum patients, what is the effectiveness or comparative effectiveness of interventions that impact the probability of initiating and continuing breastfeeding or lactation?
  - Do outcomes differ for the following subpopulations: racial/ethnic minorities, rural, economically disadvantaged, Military/ Veterans?

<table>
<thead>
<tr>
<th>Recommendation</th>
<th>Strength</th>
<th>Category</th>
</tr>
</thead>
<tbody>
<tr>
<td>Routine Care</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Lactation</td>
<td></td>
<td></td>
</tr>
<tr>
<td>3. We suggest assessing all patients for risk factors that impact initiation and continuation of lactation, including obesity, depression, inappropriate gestational weight gain, and gestational diabetes mellitus.</td>
<td>Weak for</td>
<td>Reviewed, New-added</td>
</tr>
<tr>
<td>4. We suggest individual or group lactation education delivered via in-person, telemedicine, or multimedia modalities be provided for all pregnant and postpartum patients to improve the probability of initiating and continuing lactation.</td>
<td>Weak for</td>
<td>Reviewed, New-replaced</td>
</tr>
</tbody>
</table>
Discussion of Risk Factors that Impact Lactation

- The evidence identified risk factors, such as obesity and overweight, depression and anxiety, metabolic dysfunction (GDM), and inappropriate gestational weight gain.
- The work group’s confidence in the quality of this evidence to be low to fair; however, the findings carry substantial weight and are very important to mention.
- Providers should be aware of risk factors suspected to impact lactation. Bringing awareness to these risk factors enables the provider to help patients meet their individual goals.
- Patients who present with these risk factors and desire to breastfeed might need additional support or referral to ensure lactation success.
Discussion of Lactation Interventions

- The evidence suggested that individual or group lactation education delivered via in-person, telehealth, or multimedia modalities increased the probability that pregnant and postpartum patients would initiate and continue lactation.

- Lactation education is provided and offered to patients in various ways. Lactation education differs immensely across clinical settings.

- Lactation education should be tailored to the needs of the individual patient and the resources available in the community.

- Overall, the benefits of individual and group lactation education on the probability of initiating and continuing lactation outweighed the potential harms.
Routine Obstetric Recommendations

- What is the impact of prenatal and postpartum care delivered through telemedicine on maternal and neonatal outcomes?
  - Do outcomes differ for the following subpopulations: racial/ethnic minorities, rural, economically disadvantaged, Military/ Veterans?
- What is the effectiveness of strategies to reduce healthcare/racial disparities in pregnancy and childbirth?

<table>
<thead>

</tr>
<tr>
<td>10. There is insufficient evidence to recommend for or against specific</td>
<td>Neither</td>
<td>Reviewed, New-added</td>
</tr>
<tr>
<td>interventions that would diminish disparities in perinatal care access and</td>
<td>for nor</td>
<td></td>
</tr>
<tr>
<td>maternal and childbirth outcomes.</td>
<td>against</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Telemedicine Discussion

- U.S. Department of Health and Human Services' definition of telemedicine, which broadly defines telemedicine as the use of electronic information and telecommunications technologies to support and promote long-distance clinical health care.
- The workgroups quality of the evidence was low.
- The evidence suggested no difference between telemedicine and treatment as usual.
- The patient focus group findings highlighted preferences for continuity of care and feelings that telemedicine might help provide continuity when FTF visits are difficult or impossible.
- No Harms were reported.
## Routine Obstetric Recommendations

- **Not Reviewed**

<table>
<thead>
<tr>
<th>Recommendation</th>
<th>Strength</th>
<th>Category</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Routine Care</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Selected Conditions</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td>7. We recommend offering scheduled delivery to patients who reach 41 weeks and 0/7 days undelivered. Antepartum fetal testing should begin at 41 weeks and 0/7 days if not delivered.</td>
<td>Strong for</td>
<td>Not reviewed, Amended</td>
</tr>
<tr>
<td>8. We suggest that patients with uncomplicated pregnancies may continue a standard work schedule throughout their pregnancy.</td>
<td>Weak for</td>
<td>Not reviewed, Amended</td>
</tr>
</tbody>
</table>
Discussion on Selected Conditions

- Scheduled Delivery 41 weeks and antepartum testing
  - Although not part of the previous systematic evidence review from the 2018 VA/DoD Pregnancy CPG, subsequent studies continued to support the findings that induction of labor at 41 weeks is associated with a reduction in perinatal mortality and a reduction in rates of cesarean section.

- Work Schedule for uncomplicated pregnancies
  - The benefits of this recommendation slightly outweighed the potential harms for patients with uncomplicated pregnancies. Patient values and preferences varied somewhat because some patients might need to work, although others might prefer to lessen work burden.
Routine Obstetric Recommendations

What is the comparative accuracy and safety of screening methods (including NIPT) used to screen for aneuploidy in pregnant patients?

<table>
<thead>
<tr>
<th>Recommendation</th>
<th>Strengtha</th>
<th>Categoryb</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Routine Care</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Aneuploidy Screening</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td>1. We recommend offering non-invasive prenatal testing as the prenatal screening test of choice for all patients with singleton pregnancies who choose aneuploidy screening.</td>
<td>Strong for</td>
<td>Reviewed, New-added</td>
</tr>
<tr>
<td>2. We suggest non-invasive prenatal testing for patients with twin pregnancies who choose aneuploidy screening.</td>
<td>Weak for</td>
<td>Reviewed, New-added</td>
</tr>
</tbody>
</table>

a See Determining Recommendation Strength and Direction section of the Pregnancy CPG for additional information.
b See Recommendation Categorization section of the Pregnancy CPG for additional information.
Discussion of aneuploidy screening

- Evidence suggests that NIPT, with cell-free fetal deoxyribonucleic acid screening for aneuploidy, is a superior screening test for aneuploidy.
- For patients who choose aneuploidy prenatal screening, the benefits of NIPT far outweigh the potential risks.
- The Work Group’s confidence in the quality of the evidence was moderate to low.
- The benefits of NIPT for aneuploidy screening in singleton and, to a lesser extent, twin gestation because of superior test performance parameters outweighed the potential harm of anxiety associated with false positive testing.
- Patient values and preferences varied somewhat because of differing preferences surrounding genetic testing.
Knowledge Check

Audience Poll Question
Case Study: Emily

- 27 years old, G2 P1 at 13w4d

- Relevant Health History:
  - Elevated blood pressure towards the end of first pregnancy
  - Preterm delivery at 34 weeks in her first pregnancy due to preterm labor
  - Anxiety, no medications
  - Thinks she may have had postpartum depression last pregnancy, but never sought help from her clinicians
  - Struggled with lactation in her first pregnancy, motivated to try again this time
Audience poll question

Based on our recommendations for lactation, which intervention would you suggest?

A. Cognitive processing therapy
B. Individual group or lactation education and support
C. Interpersonal psychotherapy
D. Peer support
Complicated Obstetrics
# Clinical Practice Recommendations

<table>
<thead>
<tr>
<th>Recommendation</th>
<th>Strength(^a)</th>
<th>Category(^b)</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Complicated Obstetrics</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Preterm Delivery</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td>11. We recommend considering fetal fibronectin testing as a part of the evaluation strategy in patients between 24 0/7 and 34 6/7 weeks' gestation with signs and symptoms of preterm labor, particularly in facilities where the result might affect management of delivery.</td>
<td>Strong for</td>
<td>Not reviewed, Amended</td>
</tr>
<tr>
<td>12. We suggest vaginal progesterone or cerclage for singleton pregnancy with short cervix, history of spontaneous preterm birth, or both depending on patient characteristics and preferences.</td>
<td>Weak for</td>
<td>Reviewed, New-added</td>
</tr>

<td>Neither for nor against</td>
<td>Reviewed, New-added</td>
</tr>
</tbody>
</table>

---

\(^a\) See Determining Recommendation Strength and Direction section of the Pregnancy CPG for additional information.

\(^b\) See Recommendation Categorization section of the Pregnancy CPG for additional information.
Preterm Delivery Recommendations Discussion

• Preterm birth history can be complex and the resulting counseling and management options are nuanced

• The removal of IM Progesterone from the US market results in 2 potential interventions – vaginal progesterone and cerclage – tailored to patient history, examination findings, and preferences

• Patients with a history of spontaneous preterm birth warrant consultation with an Obstetrician and/or Maternal Fetal Medicine Specialist

• Fetal fibronectin can be used as part of the evaluation of preterm labor symptoms

• There is no evidence to support the use of aspirin for spontaneous preterm birth prevention alone
Knowledge Check

Audience Poll Question
Recall that Emily has a history of spontaneous preterm birth at 33 weeks in a prior pregnancy.

Which of the following is the best plan of care based on Emily’s history?

A. Refer her to consultation with a high risk obstetric provider to discuss her history and the options of vaginal progesterone, cerclage, or both
B. Prescribe her aspirin solely based on her history of preterm birth
C. No special attention is needed to this history – routine care, unless she has preterm labor symptoms
D. Provide a follow-up appointment weekly
# Clinical Practice Recommendations

</tr>
</tbody>
</table>

---

*a* See Determining Recommendation Strength and Direction section of the Pregnancy CPG for additional information.

*b* See Recommendation Categorization section of the Pregnancy CPG for additional information.
Hypertensive Disorders of Pregnancy Discussion

• Prenatal aspirin is an evidence based intervention to reduce risk of developing preeclampsia in patients with risk factors
• Initiation before 16 weeks has proven to have the greatest efficacy
• Common dose in the US is 81 mg (baby ASA)
  – Doses >100 mg seem to be more effective in preventing preeclampsia without an increase in the number of adverse events
• Evidence base is limited regarding the optimal use of home blood pressure cuffs – this does not mean home blood pressure cuffs are not useful
• Following the DASH diet was also effective in reducing the risk of developing preeclampsia in patients with other cardiometabolic disorders
Knowledge Check

Audience Poll Question
Recall that Emily has a history of gestational hypertension in her prior pregnancy.

Which of the following is the best plan of care based on Emily’s history?

A. Provide Emily with a blood pressure cuff for home measurements
B. Prescribe her aspirin starting at 12 weeks
C. No additional interventions beyond routine blood pressure monitoring at her prenatal visits
D. Provide an office follow-up appointment weekly

<td>Not reviewed, Amended</td>
</tr>
</tbody>
</table>

\(^a\) See Determining Recommendation Strength and Direction section of the Pregnancy CPG for additional information.

\(^b\) See Recommendation Categorization section of the Pregnancy CPG for additional information.
Scope of Mental Health Recommendations

- To avoid overlap with other VA/DoD CPGs, evidence for and use of psychotropic medications during pregnancy and postpartum were not included in this CPG.

- Examples of other CPGs that include recommendations and/or discussion about psychotropic use in pregnancy:
  - Management of Bipolar Disorder (BD) (2023) - VA/DoD Clinical Practice Guidelines
  - Management of Major Depressive Disorder (MDD) (2022) - VA/DoD Clinical Practice Guidelines
  - Management of Substance Use Disorder (SUD) (2021) - VA/DoD Clinical Practice Guidelines
Mental Health (MH) Interventions: Strong Recommendations

In pregnant and postpartum patients, what is the effectiveness of interventions to promote and support maternal mental health?

<table>
<thead>
<tr>
<th>Recommendation</th>
<th>Strength</th>
<th>Category</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Mental Health</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Treatment</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td>23. We recommend offering individual or group Interpersonal Psychotherapy or</td>
<td>Strong for</td>
<td>Reviewed, New-added</td>
</tr>
<tr>
<td>cognitive behavioral therapy for pregnant patients at risk of perinatal</td>
<td></td>
<td></td>
</tr>
<tr>
<td>depression.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>24. We recommend offering Interpersonal Psychotherapy for treating depression</td>
<td>Strong for</td>
<td>Reviewed, New-added</td>
</tr>
<tr>
<td>during pregnancy or postpartum.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

*a* See Determining Recommendation Strength and Direction section of the Pregnancy CPG for additional information.

*b* See Recommendation Categorization section of the Pregnancy CPG for additional information.
Discussion of Strong MH Interventions

- Strong evidence suggests that
  - Interpersonal Psychotherapy (IPT) and Cognitive Behavioral Therapy (CBT) are effective *preventive interventions* for postpartum depression.
  - IPT is an effective *treatment* for perinatal depression.
- For either of these psychotherapies, benefits outweigh risks.
- The Work Group’s confidence in the quality of the evidence was high for prevention, moderate for treatment.
- Patient values and preferences may vary somewhat. Some patients may prefer pharmacotherapy and/or find the treatment burden of psychotherapy challenging.
MH Interventions: Weak Recommendations

In pregnant and postpartum patients, what is the effectiveness of interventions to promote and support maternal mental health?

<table>
<thead>
<tr>
<th>Recommendation</th>
<th>Strength</th>
<th>Category</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Mental Health</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Treatment</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td>25. We suggest offering cognitive behavioral therapy for treating depression during pregnancy or postpartum.</td>
<td>Weak for</td>
<td>Reviewed, New-added</td>
</tr>
<tr>
<td>26. We suggest offering peer support for people with perinatal depression or risk of perinatal depression to improve depressive symptoms.</td>
<td>Weak for</td>
<td>Reviewed, New-added</td>
</tr>
<tr>
<td>27. We suggest exercise, mindfulness, yoga, or any combination of these interventions for depressive symptoms in perinatal patients.</td>
<td>Weak for</td>
<td>Reviewed, New-added</td>
</tr>
</tbody>
</table>

*a* See Determining Recommendation Strength and Direction section of the Pregnancy CPG for additional information.

*b* See Recommendation Categorization section of the Pregnancy CPG for additional information.
Discussion of Weak MH Interventions

- Among psychotherapies, weaker evidence suggests that CBT is an effective treatment for perinatal depression.
- Evidence also suggests that several other interventions (peer support, exercise, mindfulness, yoga) can reduce depressive symptoms.
- For these interventions, benefits outweigh risks.
- The Work Group’s confidence in the quality of the evidence was low.
- Patient values and preferences may vary somewhat. Time commitment is a barrier for some interventions.
# Recommendations Related to Anxiety and Trauma

What is the effect of anxiety, trauma (including interpersonal), and distress on perinatal outcomes?

Discussion of Anxiety/Trauma Recommendations

- PTSD screening
  - Evidence suggests that active PTSD during pregnancy is associated with increased pregnancy complications in Veteran populations, warranting screening for active symptoms among those with PTSD diagnoses and offering treatment when indicated.

- Treatment of anxiety symptoms
  - Evidence suggests efficacy for two types of psychotherapy (CBT, IPT) and yoga for reducing anxiety symptoms during pregnancy or postpartum.

- Both
  - The Work Group’s confidence in the quality of the evidence was low.
  - For these interventions, benefits outweigh risks.
  - Patient preferences may vary.
## Other Mental Health Screening Recommendations

Knowledge Check

Audience Poll Question
Case Study

Remember Emily?

• 27 years old, G2 P1 at 13w4d
• Relevant Health History:
  – Elevated blood pressure towards the end of first pregnancy
  – Preterm delivery at 34 weeks in her first pregnancy due to preterm labor
  – Anxiety, no medications
  – Thinks she may have had postpartum depression last pregnancy, but never sought help from her clinicians
  – Struggled with lactation in her first pregnancy, motivated to try again this time
Audience poll question

Emily wants to reduce her anxiety and prevent postpartum depression from recurring. She prefers nonpharmacologic interventions. Which of the following interventions has the strongest evidence for efficacy for those goals?

A. Cognitive processing therapy
B. Mindfulness-based interventions
C. Interpersonal psychotherapy
D. Peer support
